

# Instructions for installing social net database

1. Run SocialNetDDL script as root admin we need a database first
2. Run SocialInitialDatabaseUsers
3. Execute SocialNetStoredProcedures
4. Execute SocialNetTriggers

Note: all those you can execute as root admin or you can login as SocialAdmin, Regular user cannot execute procedures and triggers

5. We need social\_admin and regular users into database user table. Use SocialNetDML\_script to find then and insert them into database user. Stored procedure with trigger will insert those users in database logger for logging database based on user logged in as database connection. Note: you need to sign\_in as social\_admin to do that

6. Need to add some data to account type. You need to be logged in as social\_admin to do so.

Procedure limit user to be social\_admin. If you need some other user to do changes, you need to modify stored procedure. Note: some procedures for logging needs Admin and Regular. They are using data from that table for checking. Also, this is possible to change by modifying stored procedure.

7. Need to update database user need to set account type id for Admin and Regular. Id depends of id written in account type. Some stored procedures has Regular and Admin from account type for limiting some operations on tables, for example social admin can only modify account type.

8. (optional) Need to test other dml scripts to see if logger is working. Also if you are testing, it is needed to test for regular user too.

9. Installation is complete. Now you can use database, modify it.
