

Instructions for installing social net database

1. Run SocialNetDDL script as root admin we need a database first

for linux: use SocialNetDDL_script_linux_script
you need to check column data index for some tables table name is for example lowercase, some indexes are lowercases, need to check that before installation, additional updates of the script will come in the future
use linux v2 version

2. Run SocialInitialDatabaseUsers

3. Execute SocialNetStoredProcedures

note: need to update procedure in future versions instead of && and will be used

4. Execute SocialNetTriggers

Note: all those you can execute as root admin or you can login as SocialAdmin, Regular user cannot execute procedures and triggers

Note: if you have problems to run trigger script, use SocialNetTriggers_linux script

note: if you do not have super user privileges, connect as main admin, also in this script you have possible solution for this problem if you do not want to be super user

5. Use SocialNetDMLSocialAdminRegularInsert to insert social_admin and regular user into database user table. It is necessary to have it because of database logger. Note: you need to login as social_admin to do that

6. Use SocialNetDMLAddAccountTypes to add some account type data into account type table. Also need to update account type in database user. Use update parts of the script to do that.

7. Add some state and city data by using SocialNetDMLAddCityStateData script.

8. Need at least one register user to have a functional login site. This will be main admin. Although we have made login page to setup user role if there is no admin, default admin is needed. Use SocialNetDMLAddRegisteredadmin to do that. Since we have procedure which saves automatic
9. Installation is complete. Now you can use database, modify it.

Note: all scripts for linux and for windows must have correct table syntax need to update everything.
This documentation can only be used for windows, need also to update for windows too.
